

# SPACED OUT

Protect your roof battens and slates by providing a little extra breathing space between the slates. The stainless steel SlateSpacer (below left) is placed under the exposed ends of each slate to create a gap, preventing moisture build up under the slates, and to allow air to pass through unimpeded. It increases the lifespan of the slates, as they dry quicker. They also break less, and can withstand stronger winds. Check out [www.slatespacer.com](http://www.slatespacer.com) for more information.

The SlateSpacer is available in the UK from David Wallace Slate International [www.slate.uk.com](http://www.slate.uk.com)
